CreateSpace Independent Publishing Platform. Paperback. Book Condition: New. This item is printed on demand. Paperback. 328 pages. Dimensions: 11.0in. x 8.5in. x 0.7in. This comparative effectiveness review evaluates local hepatic therapies for patients with unresectable primary hepatocellular carcinoma (HCC) who are not candidates for surgical resection or liver transplantation. Here we describe the epidemiology and staging of HCC, as well as currently available treatment strategies. We also discuss the current practice guidelines and the impetus for this review. Hepatocellular carcinoma is the most common primary liver tumor. It is the fifth most common cancer and the third leading cause of cancer death worldwide. Overall 5-year survival rates for HCC are less than 10 percent in Europe and the United States. The main etiology of HCC is chronic infection with the hepatitis B and hepatitis C viruses. Approximately 4 million individuals in the United States are chronically infected with hepatitis C virus, and the annual incidence rate of HCC among patients with hepatitis C related cirrhosis is estimated to be between 2 and 8 percent. Unlike the case with most solid tumors, the incidence of and mortality rate due to HCC are projected to increase worldwide in the next 20 years, primarily due to the dissemination of hepatitis C virus infection. Other causes include cirrhosis due to any cause (e. g. , alcohol), hereditary hemochromatosis and iron overload syndromes, nonalcoholic fatty liver disease, obesity, diabetes, and environmental toxins (e. g. , aflatoxin, chewing of betel quid, and contaminated water). While there are several causes of HCC, etiology is not an independent prognostic factor for HCC; rather, the underlying cirrhosis impacts prognosis and treatment decisions. In the United States, most cases of HCC occur in patients with cirrhosis. A small proportion, approximately 5 percent, of all HCC cases in Western countries occur in patients...
