These proved the scant presence of sulphides in the limestone but not sufficiently concentrated to be workable. The rock containing the original sulphide ores which yielded on weathering the workable soft ores, calamine and smithsonite, is a medium to dark gray magnesian limestone. It is thin bedded and much crushed, but not so coarsely crystalline as at Austinville. The crushed rock is recemented with white calcite or dolomite, in the form of films and stringers. Less than half a mile north from the mine openings, exposures of the interbedded thin banded purplish red shale and limestone are seen along the tram track between the mines and the mill. Several bands of the shale are repeated with the limestone at this point. Both the shale and the limestone are cut by well defined joints in two directions. Measurements of...
